Interfaces Used

Interface	Direction (caller → provider)	Purpose
IProposal	Portal UI → Proposal Manager	Lets the user create and view an event proposal from the portal. Carried over HTTPS/REST.
IAuth	Portal UI → Authentication	Handles login and role checks so the portal knows who the user is and what they are allowed to do.
IWorkflow	Proposal Manager → Approval Workflow	Starts the approval workflow for a proposal and updates its status as it moves through approval.
IApproval	Proposal Manager → Ticketing Service	Submits an approved proposal to ticketing and returns the final status.
IQRCode	Ticketing Service → QR Generator	Generates QR tickets and validates them when attendees use them.
INotify	Approval Workflow / QR Generator → Notification Service	Sends status updates from the workflow, and sends ticket details to attendees from the QR Generator.
IReport	Reporting Service → Database	Reads event, budget and ticket data so reports can be produced. Carried over HTTPS/REST.
IData	Approval Workflow → Database	Reads and writes proposals, statuses, budgets and tickets in the data store.

How the pieces fit together

A user works through the **Portal UI**, which calls **Authentication** (IAuth) to log in and check the user's role. When the user creates or views an event proposal, the Portal UI calls the **Proposal Manager** (IProposal). The Proposal Manager starts the **Approval Workflow** (IWorkflow), which stores proposals, statuses and budgets in the **Database** (IData) and sends status notifications through the **Notification Service** (INotify).

Once a proposal is ready, the Proposal Manager submits it to the **Ticketing Service** (IApproval) and gets the final status back. Ticketing asks the **QR Generator** (IQRCode) to create and validate QR tickets, and ticket details reach attendees through the Notification Service (INotify). Separately, the **Reporting Service** reads event, budget and ticket data from the Database (IReport) to produce reports.
